## **New Engine Lubrication Company Offers Biodegradable “Green” Treatment for Marine Engines**

*Green Lubrication Solutions represents a patented engine treatment product that improves gas mileage, reduces emissions, and is completely environmentally safe & biodegradable*

(Portland, OR) April, 2008 –FOR IMMEDIATE RELEASE: The newly formed **Green Lubrication Solutions™** (GLS), is joining the nation’s growing number of companies offering products or services formulated for minimal impact on the environment. Officially formed in December 2007, the company is a worldwide distributor of a unique line of lubrication and engine enhancement products (**MotorSilk™** and **LubriSilk™**) that provide significant cost savings, and an easy to implement option for those looking to “go green” and use less oil.

Company officials expect that both boaters and marine fleets nationwide will quickly adopt this product line. “It just makes sense; they save money on gas and maintenance,” said Randy Hufford, GLS President. “We are very excited to be representing this product, because it really can make a big difference in reducing our use of fossil fuels and saving money during harsh economic times. We feel it’s just a matter a time before practically every recreational boat and marine fleet in America will make this a standard part of their engine and equipment maintenance, because of the remarkable engine benefits.”

**Marine MotorSilk offers ultimate protection against salt water corrosion, forming a 100% anti-corrosive Boric Oxide layer on any metal surface.** The Lubrisilk grease protects boat trailer wheel housings from corrosion and its biodegradable, non-toxic qualities make it environmentally sound. The Hydraulic fluid product and lubricant spray have many uses in marine applications as well.

The products offered by Green Lubrication Solutions treat engines with a patented lubrication technology invented by the U.S. Department of Energy which significantly increases energy efficiency, reduces emissions, saves gas and lubrication oil use. More importantly, the products are fully biodegradable and non-toxic. Also unlike typical oil additives and lubricants, the GLS products require only one treatment to provide long-term engine benefits. The product bonds to engine metal surfaces to greatly decrease friction, increasing power and gas mileage, as well as reducing wear resulting in long-term maintenance cost savings.

A comprehensive Press Kit is available, which details the product line offered by GLS, the technology behind them, a full explanation of how they work, and corresponding environmental benefits. Interviews with Randy Hufford and/or MotorSilk users are also available.
